

# AI Usage DISCLOSURE FORM

## 1. Team Details

Team Name: Team StateShift

Project / Product Name: RePlan

Organization / Institution (if any): VIT, Vellore

Submission Date: 30<sup>th</sup> September 2026

## 2. AI Usage Declaration

Did your team use any Artificial Intelligence (AI) in developing this project? Yes / No

\_\_\_\_\_

The system design, architecture, and component ownership (runtime core, interaction layer, tools/chaos/evidence, console/demo) originated with the team. AI (Claude/Claude Code) was used as an implementation assistant against that design — generating and accelerating code, docs, and this deck — with every output reviewed, tested, and modified by the team before being accepted.

## 3. Purpose of AI Usage ( Brief Details)

Idea generation / brainstorming: Architecture

Options, and brainstorming

Code generation or assistance: Implementation

Work

UI / UX design: Yes, to refine the

UI to make some changes and

correct some errors

Content creation: Readme

Data analysis: To check with the

reference dataset and validation

to generate the (35) score.

Testing / debugging: Reviewing

Code and Chasing Failures

Other

#### 4. Feature Origin Classification ( Please add/delete based on the number of the feature)

1. Feature Name LiveKit voice I/O (STT + Turn Detection)

2. Self-Generated/AI-Generated/Both [Both][Claude Code]

3. Description ( include AI tools/platform Used, prompt used , Output Summary, Modification) We implemented real-time speech I/O featuring partial and final transcription, local turn detection, and low-latency barge-in. The AI generated the core components: the speech-agent abstraction, mic/playback adapters, WebRTC-VAD endpointing, and dual local/provider interruption logic. The team then reviewed the audio contracts, fine-tuned thresholds and sample rates, and finalized the runtime integration. Note: The checked-in code relies on FreeLLM API for STT/TTS and local WebRTC VAD.

1. Feature Name Hypothesis Classifier

2. Self-Generated/AI-Generated/Both [Both] [Claude Code]

3. Description ( include AI tools/platform Used, prompt used , Output Summary, Modification) We implemented real-time speech I/O featuring partial and final transcription, local turn detection, and low-latency barge-in. The AI generated the core components: the speech-agent abstraction, mic/playback adapters, WebRTC-VAD endpointing, and dual local/provider interruption logic. The team then reviewed the audio contracts, fine-tuned thresholds and sample rates, and finalized the runtime integration. Note: The checked-in code relies on FreeLLM API for STT/TTS and local WebRTC VAD.

1. Feature Name Freeze Controller + Speculator Executor

2. Self-Generated/AI-Generated/Both [Both] [Claude Code]

3. Description ( include AI tools/platform Used, prompt used , Output Summary, Modification) We implemented safe speculative async execution featuring dependency-based freezing, budget limits, and protection against state changes during dispatch. The AI built the core freeze controller, async executor, and result parking flow. Our team enforced architectural rules, corrected edge cases like capturing fingerprints before task creation, and ensured irreversible actions are safely blocked.

1. Feature Name Commit Gate + Reconciler

2. Self-Generated/AI-Generated/Both [Both] [Claude Code]

3. Description ( include AI tools/platform Used, prompt used , Output Summary, Modification) We created a single-writer commit gate that only accepts results if

their dispatch fingerprint matches the current state, alongside a reconciler that reuses valid work and drops stale tasks. The AI wrote the commit logic and reconciliation code, which the team then integrated with versioned state, refining duplicate handling, cache-first reuse, and compensation for reversible effects.

1. Feature Name Extension Use Case

2. Self-Generated/AI-Generated/Both [Both] [Claude Code]

3. Description (include AI tools/platform Used, prompt used , Output Summary, Modification) We expanded the runtime into smart-home and in-car scenarios to demonstrate stale-result rejection and reversible-action compensation. The AI generated in-memory tools and compensators like route cancellation and temperature restoration. The team finalized the scenarios, tuned interruption timing, and verified that stale evidence is recorded without triggering incorrect actions.

1. Feature Name Demo Video and Submission Deck

2. Self-Generated/AI-Generated/Both Self Generated

3. Description (include AI tools/platform Used, prompt used , Output Summary, Modification) Laptop, Loom. Provides the summary and demo for the project Replan and provides its overall insight.

## 5. Ethical & Compliance Confirmation

AI usage complies with guidelines and policies. Yes

No proprietary or copyrighted data misused. I **Agree**

## 6. Declaration & Sign-Off

Name of Team Representative: Lakshya Asnani

Role: Team Leader

Signature:

A handwritten signature in blue ink on a light-colored background. The signature is stylized, with a large, sweeping 'L' and 'A' that form a continuous loop. The name 'Lakshya Asnani' is written in a cursive script, with 'Lakshya' on the top line and 'Asnani' on the bottom line, both underlined.

Date: 30<sup>th</sup> September 2026
